Introduction to Airport Express:

- Airport Express is an Apple product which can stream in (wirelessly) files from Apple Devices or through a PC (through Ethernet) with I-Tunes.
- It has following Audio interface
 - 3.5mm stereo Analog out.
 - Mini Toslink Optical digital out.
- Can be connected to the router for Multizone Application.

Connecting Airport Express to VIOLET3D

• Mini-stereo to mini-stereo cable (3.5mm) i.e. to A2 of VIOLET3D.

• Mini-stereo (3.5mm)-to-dual-RCA cable i.e. to A1 of VIOLET3D.

• You can connect your AirPort Express to your VIOLET3D with a mini Toslink to digital converter (to D1 or D2).

Multi zone audio using Airport express

• You can connect an additional AirPort Express to extend the range of your existing AirPort Extreme or AirPort Express network.

How one can stream to Airplay from iOS

- Verify that your iOS device has Wi-Fi turned on and is associated with the same home Wi-Fi network. (Menu: settings > wifi > wifi on).
- Go to Music player.
- You can stream your music by simply tapping the licon on your iOS device and selecting a recipient from the list of available devices. You will see this menu:

AirPlay	
🖵 iPad	~
le AirPort Express	
🖵 Apple TV	

Notice the images of a speaker & next to each Airplay device in the Airplay menu. Those images indicate the type of media content you can stream to that device.

NOTES:

- Apple Airport Express can take input (audio) only from apple devices or from a computer having iTunes software.
- Airport express can be used for audio routing through LAN cable i.e. from one airport express you can take a LAN cable and connect to the next so that audio can be routed into multi rooms in case of a range drop.
- In cases where customer is using either Apple devices or is having a computer with iTunes as audio source (main console) and his entire house is already wired with LAN cables you can suggest Airport Express for multizone audio.
